

Project Title

OnePlus Buds Landing Webpage

Responsive Frontend Web Project

Project Preview:

The OnePlus Landing Webpage is a responsive frontend web project inspired by modern product showcase websites. The project focuses on creating a visually appealing and user-friendly interface using HTML, CSS and JavaScript while maintaining the responsiveness across multiple devices and screen sizes. This project is made during my first semester, where our teacher asked us to create a webpage using HTML.

Project Objectives:

- **To Design and Develop** a real-world brand's product landing webpage, as a practicing frontend developer during my learning phase. Inspired by the amazon preview page of the product.
- **To Learn and Discover** how real-world companies work on their webpages, and understand how crucial are the websites for their progress.
- **To practice building** visually engaging product showcase interfaces.
- **To implement** clean and maintainable HTML and CSS architecture.
- **This project's main objective** is to learn the responsive webpage development and to work just as a real developer works. Details were discussed in detail in the later sections.

Technologies Used:

- IDE – VS Code
- HTML5
- CSS3
- JavaScript
- Responsive Web Design (includes media queries)
- Flexbox
- CSS Grid

Features:

- Fully responsive design for mobile, tablet, and desktop devices
- Modern product-focused user interface
- Smooth layout structure and visual hierarchy
- Interactive navigation and hover effects
- Optimized section spacing and typography
- Clean and reusable frontend code structure
- Cross-device compatibility
- Can navigate through official sites through respective official site links

Challenges Faced:

The biggest challenge that I faced is to bring exactly the complete outputs and the clean structure which I imagined in my mind. Previously I have an experience of creating few such projects, though not responsive I became fluent in developing static and basic websites, even though bringing that exact website which was hosted in my mind is what I faced difficulty in, later on when I started to spend time and work on it, things started to get smoother and I was able to bring the 80-85% of the things that I imagined.

What I Learned:

Even after facing a lot of challenges in making that project, I learned to focus on every detail of the website to make it great, every detail matters for a good website, starting from setting a link to the logo in the navbar to taking care of the smallest anchor tags in the footer section. Everything matters. It also developed patience in me and I learned how to manage my work. I understood the Waterfall approach model.

Deployment Details:

I used GitHub to deploy the site and the handle to the site is: <https://kranthiaravelli.github.io/One-Plus-Buds-Landing-Page-Project/>
